Table 1: 95% CL upper limits on (sensitivities to) the amplitude of the four isocurvature modes BI, CI, BCI and CIP, from Planck data (CMB S-4 forecast), as a function of wavenumber, for a Dirac-delta spike. Our treatment only applies to  $k \lesssim 10^3 \ \mathrm{Mpc^{-1}}$ , due to our neglect of Lyman- $\alpha$  and Lyman-continuum transport. The constraints are not given if exceeds unity. See FIG. 5 in the paper.
